Cover. Typical fragmental or 'transported' ore from the MacLean Extension orebody, Buchans, NL. Fragmental ore, interpreted as gravity-driven debris flows, is the 'signature' ore type at Buchans, and is better developed and preserved at Buchans than at any other VMS district in the world. Their very rich grade, averaging 22% combined lead and zinc, made it possible for the mine to be developed in what was, at the time, a very remote location.
