Article abstract

The aim of this article is to contribute to the establishment of a sub-field of translation studies, namely a sub-field devoted to the research of intralingual translation. The article's contribution to this project is both theoretical and empirical. In the theoretical part of the article, an already existing, five-partite typology of intralingual translation is reviewed and on certain points refined. The empirical part is taken up by three case studies, each representing a particular subcategory of intralingual translation. The first study investigates translation between two geographical dialects (American and British English), the second examines the rewriting of a specialized, pharmaceutical product summary into a register aimed at lay readers, and the third investigates the modernization of one of Shakespeare's plays. A primary concern of the case studies is to chart the range and nature of the translation strategies employed in the transformation of source texts into intralingual target texts. Translation strategies are conceptualized as *shifts* in the article, and well-known concepts from translation studies are applied in the analyses. The analytical results reflect clear differences, but also certain striking similarities between the types of shifts manifested in the individual cases.

The Heterogeneity of Intralingual Translation

RÉSUMÉ

L'objectif de cet article est de contribuer à l'établissement de la traduction intralinguale comme sous-domaine de la recherche traductologique. L'article apporte une contribution à la fois théorique et empirique à ce projet. La partie théorique se compose d'une revue de la typologie pentapartite actuellement appliquée en traduction intralinguale, ainsi que d'un raffinement de certains de ses critères. La partie empirique comprend trois études de cas, chacune recouvrant l'une des catégories spécifiques à la traduction intralinguale. La première étude se penche sur la traduction entre deux dialectes géographiques (anglais américain et anglais britannique), la deuxième étude examine la retranscription d'un résumé de produit pharmaceutique dans un registre destiné aux non-experts, tandis que la troisième étude est consacrée à l'investigation de la version modernisée d'une des pièces de Shakespeare. Les études de cas s'appliquent à recenser la nature et la portée des stratégies de traduction employées dans la transformation des textes source en textes cible intralinguaux. Dans l'article, les stratégies de traduction sont conceptualisées comme des shifts, alors même que des concepts traductologiques reconnus sont appliqués tout au long des analyses. Les résultats analytiques reflètent de nettes différences, mais aussi des similitudes frappantes entre types de shifts se manifestant dans chaque cas individuel.

ABSTRACT

The aim of this article is to contribute to the establishment of a sub-field of translation studies, namely a sub-field devoted to the research of intralingual translation. The article's contribution to this project is both theoretical and empirical. In the theoretical part of the article, an already existing, five-partite typology of intralingual translation is reviewed and on certain points refined. The empirical part is taken up by three case studies, each representing a particular subcategory of intralingual translation. The first study investigates translation between two geographical dialects (American and British English), the second examines the rewriting of a specialized, pharmaceutical product summary into a register aimed at lay readers, and the third investigates the modernization of one of Shakespeare's plays. A primary concern of the case studies is to chart the range and nature of the translation strategies employed in the transformation of source texts into intralingual target texts. Translation strategies are conceptualized as *shifts* in the article, and well-known concepts from translation studies are applied in the analyses. The analytical results reflect clear differences, but also certain striking similarities between the types of shifts manifested in the individual cases.

RESUMEN

Con este artículo se pretende contribuir con la creación de un subcampo de los estudios de traducción, dedicado a la investigación de la traducción intralingüística. El objetivo es a la vez teórico y empírico. En la parte teórica se revisan y se perfeccionan cinco tipologías existentes de traducción intralingüística. La parte empírica se compone de tres estudios de casos, cada uno representando una subcategoría particular de traducción intralingüística. El primero estudia la traducción entre dos dialectos geográficos (inglés americano e inglés británico), el segundo examina la reescritura de una nota relativa a un producto

farmacéutico en un registro destinado a un público no especialista y el tercero analiza la modernización de una obra de Shakespeare. El objetivo principal de estos tres estudios de caso consiste en inventariar la naturaleza y el alcance de las estrategias de traducción adoptadas para transformar los textos originales en textos meta intralingüísticos. En el artículo, las estrategias de traducción se conceptualizan como *shifts* y los análisis se basan en conceptos muy conocidos de los estudios de traducción. Los resultados revelan claras diferencias, pero igualmente notables semejanzas entre los tipos de *shift* que aparecen en cada caso.

1. Introduction

This article is concerned with the particular translational phenomenon known as *intralingual translation* (henceforth INTRA), the language-internal rewriting of a source text (ST) into a target text (TT) with the purpose of neutralizing a potential comprehension barrier. Thus conceived, INTRA is a type of text production that, over the past few years, appears to be growing. The so-called Plain Language Movement in the US, for example, would seem to reflect a recognition on the part of public authorities that there is a need for registerial simplification of certain types of official communication with the public.¹ A parallel initiative in Germany bears witness to the same awareness, with federal authorities being now required to simplify certain types of official documents that are deemed inaccessible for ordinary citizens (Maaß, Rink, *et al.* 2014: 53). Similarly, EU institutions such as the European Court of Justice (CURIA) and the European Medicines Agency (EMA) now publish popularized versions of (longer) specialized documents, such as court rulings,² and reports on clinical trials³ of medicinal products authorized for marketing in the EU.

In certain academic fields, however, INTRA is treated with outright suspicion, for instance in literary studies and philosophy, where it is sometimes perceived as an activity that had better not be undertaken at all. Thus, calls for a linguistic modernization of the 19th-century Danish author-philosopher Søren Kierkegaard's works have met with strong opposition from Kierkegaard experts (Libak 2013⁴), and attempts to modernize the language of Shakespeare have been exposed to similar criticism (Crystal 2002; Dean 2016). When it comes to the intralingual versioning of literary works in a different dialect, attitudes are mixed. On the one hand, Denton (2007) strongly advocates for intralingual translation of British literature into American English, pointing to the culturally rooted comprehension problems between different parts of the Anglophone world. Nel (2002), Pillière (2010) and Eastwood (2011), on the other hand, all reject INTRA in literature, arguing that dialectal or sociolectal features tend to be stylistically significant and that the modification of such features may jeopardize literary quality.

Within translation studies, INTRA encounters resistance, too, being treated as a phenomenon that is not fully worthy of scholarly attention by the discipline. The present article takes the exact opposite stance, aiming to contribute to the further integration of INTRA into the research field of TS, as initially called for by Zethsen

(2009: 810), according to whom “[...] we need much more empirically-based research to provide a thorough and comprehensive description of intralingual translation and of the similarities and differences between intralingual and interlingual translation.” While comparisons of interlingual translations will not be among this article’s concerns, the aim will indeed be to contribute to a more “thorough and comprehensive description” (Zethsen 2009: 810) of INTRA than is presently available. One cardinal aspect of INTRA that has hitherto received virtually no attention is the *diversity* of the phenomenon and it is this diversity that will be explored here, both theoretically and empirically. Thus, INTRA can be seen to span a number of very heterogeneous sub-categories, already charted in a five-partite typology proposed by Gottlieb (2008). This article will therefore contribute to the theorizing of INTRA by reviewing Gottlieb’s typology. Empirically, the article will feature a comparative study of three out of five INTRA species, with the purpose of charting the differences as well as the similarities in how STs are transformed into intralingual TTs. The ST-to-TT transformation will be investigated along four different parameters initially identified in Hill-Madsen (2014):

- 1) *Degree of transfer*, that is the extent to which the semiotic content of the ST is represented in the TT. Not all ST content may be transferred.
- 2) *Degree of derivation*: Here the focus is the opposite, namely the extent to which the TT’s semiotic content originates in the ST. Parts of the TT may have no ST origin.
- 3) *Degree of translation*: This aspect is concerned with those parts of the TT that do originate in the ST. In those parts, the question is to what extent the ST-to-TT conversion is a result of linguistic *changes*, rather than simple reduplication of ST wordings.
- 4) *The nature and range of the translation strategies deployed*: The concept of *strategy* relevant for the present investigation consists of changes in lexis, grammar and spelling. This aspect, in other words, is a continuation of aspect no. 3, being concerned with those parts of the TT that have not only been derived from the ST, but have also been rewarded or have undergone changes in spelling. The question concerns the nature of these lexico-grammatical and orthographic changes.

The structure of the rest of the article will be as follows: Section 2 will outline the translation-theoretical underpinnings of the article, Section 3 will be devoted to a review of Gottlieb’s (2008) INTRA typology, and Section 4 will be concerned with three case studies, all of which are based on English-language data. An introduction to each case will be given in Section 4.

2. Theoretical underpinnings: INTRA as a translation category

Relying on Jakobson’s (1959: 233) famous tripartite translation typology (consisting of three species: *intralingual*, *interlingual*, and *intersemiotic*) as its theoretical point of departure, this article is premised on the recognition of INTRA as a translational category which must be accorded full membership in the overall concept of translation, completely in line with interlingual translation. *Translation*, in other words, must be regarded as a superordinate concept, with INTRA and interlingual translation as two parallel sub-categories (and intersemiotic translation as a third). However, not all TS scholars subscribe to this view, including Newmark (1991: 69), Mossop (1998: 252; 2016), Schubert (2005: 126), Eco (2003: 127-30) and Trivedi (2007: 285-86), who all oppose extending the boundaries of the translation concept beyond interlin-

gual translation. Eco (2003: 127-30), in fact, goes so far as to ridicule the concept of intralingual translation, making a point of putting inverted commas around the word *translation* when using it to refer to other forms of semiotic conversion than translation in the ordinary sense (Eco 2003: 2). A similar practice (putting inverted commas around the word *translation*) is found in Nel (2002), who nevertheless wavers between inserting and omitting the inverted commas when referring to INTRA (between dialects of English - see Section 4.1). The inconsistency appears to reflect hesitations about treating INTRA as a truly translational category.

A number of other scholars, on the other hand, concur in widening the boundaries of the translation concept beyond its common-sense content, including Petrilli (2003a), Ponzio (2003), van Vaerenbergh (2003), Göpferich (2004, 2007), Tymoczko (2007), Zethsen (2007, 2009, 2018), Schmid (2008, 2012), Albachten (2013, 2014), Maaß, Rink, *et al.* (2014), Hill-Madsen (2015a), Karas (2016), and Korning Zethsen and Hill-Madsen (2016). Of these authors, Zethsen (2007), Schmid (2008, 2012) and Korning Zethsen and Hill-Madsen (2016) offer extensive, theoretical arguments in favour of broadening the translation concept so as to include INTRA. Aiming to move beyond this debate, the present article is *premised* on this recognition of INTRA as a translational category, which is why only two cardinal points made by Korning Zethsen and Hill-Madsen (2016) will be briefly restated here. Firstly, in defining translation, Korning Zethsen and Hill-Madsen (2016) introduce the possibility of separating an academic conception of translation from a common-usage, or lay, understanding (according to which translation is interlingual only). To be more specific, an academic perspective may not only *depart* from lay or 'folk' notions, but may also cover a more well-defined and fine-grained taxonomy. Secondly, Korning Zethsen and Hill-Madsen (2016) argue that since translation centrally consists of the mediation of *meaning* across a (potential) comprehension gap, it is immediately apparent that these are traits that translation in the ordinary sense shares with numerous other possibilities of meaning transfer, from a ST to a TT, across semiotic barriers. Accordingly, building on Steconi (2004, 2007), Korning Zethsen and Hill-Madsen (2016) hold that, in a definition of translation, the perspective should be expanded to *mediated semiosis*, irrespective of the particular type of semiotic resource deployed in the source and target, irrespective of any particular type of semiotic *difference* that constitutes the ST-TT divide. A semiotic barrier that necessitates translation may be a language-*internal* one, for example between two mutually unintelligible language varieties, as much as it may reside in the difference between two 'national' languages such as English and French, or in the difference between language as such and another sign system altogether. On the basis of this broad semiotic perspective, Korning Zethsen and Hill-Madsen (2016) reject the restricted, common-usage notion of translation, concluding that an academic concept of translation must be expanded far beyond this. As already mentioned, this conclusion is the present article's theoretical point of departure, which means that the translational status of INTRA will not be further debated here but treated as a given.

3. A typology of INTRA

Following the previous section's outline of the translation-theoretical foundations of the article, the present section proceeds to theorize INTRA through a review of a

typology offered by Gottlieb (2008). The translational status of the individual categories of the typology will be discussed in the cases where this status may be questionable, and borderline cases will be identified and discussed where relevant. It should be noted that less comprehensive typologies have been proposed by Petrilli (2003b) and Gottlieb (2007), both of whose categories correspond to those found in Gottlieb (2008), but since the latter cogently argues for additional categories, it is the one adopted as a point of departure here⁵. Gottlieb (2008) identifies a total of five INTRA sub-categories: 1) *diachronic*; 2) *dialectal* (termed *diglossic* in Petrilli (2003b: 19); 3) *paraphrasing* (termed *diaphasic* in Petrilli 2003b: 19); 4) *transliteration* and 5) *diamesic* (same term in Petrilli 2003b: 19). Only the third category (*paraphrasing/diaphasic*) is not represented in Gottlieb (2007). The typology is to be seen as a continuation of Jakobson's (1959: 233) primary, tripartite subdivision of the translation concept, taking the first level of the taxonomy to the next step in granularity. A graphical representation is shown in Figure 1:

FIGURE 1

A graphic representation of Gottlieb's (2008) INTRA typology

3.1. Diachronic INTRA

The *diachronic* category is concerned with translation between different historical varieties of the same language, typically in the form of modernized versions of pre-modern literary works (Gottlieb 2008: 56). Examples are the Old Testament translated into modern Hebrew (see Karas 2016), and the New Testament and ancient Greek classics translated into modern Greek (see Remediaki 2013; Seel 2015). In English, classics such as Chaucer and Shakespeare exist in modern-language versions (for an overview of Shakespeare modernizations, see Delabastita 2017).

3.2. Dialectal INTRA

The *dialectal* category (Gottlieb 2008: 57) represents translation between synchronic language varieties on a geographical dimension, which makes the category in itself a borderline case between inter- and intralingual translation (Toury 1986: 1113). The well-known linguistic concept of *dialect continua*, the phenomenon by which different dialects shade into separate *languages* (Heap 2006; Trudgill 2006), means that translation between closely related and mutually intelligible languages such as

Polish, Czech and Slovakian or between Danish and Norwegian (Trudgill 2006) borders on INTRA. Conversely, translation between distant dialects such as the Cantonese and the Mandarin varieties of Chinese can be seen as bordering on interlingual translation.

3.3. *Diaphasic INTRA (paraphrasing)*

The category that Gottlieb (2008: 57) terms *paraphrasing* is one for which Petrilli's alternative label *diaphasic* will be preferred here, in order to avoid confusion with the ordinary use of the term *paraphrase* within translation studies, namely as a reference to a specific type of micro-level translation strategy (for example Chesterman 1997: 104). *Diaphasic* INTRA refers to a simplification of linguistic register, exemplified in "[...] situations where public authorities wish to communicate more effectively with clients or voters by making syntactically complex and expert-sounding texts easier to read for the non-expert" (Gottlieb 2008: 57). It should be noted, however, that this 'downward' transformation from a highly specialized to a non-specialized register has its counterpart in a converse 'upward' movement, namely in cases where non-expert utterances are translated into the expert's field-specific terminology (see also Hill-Madsen 2015a: 88). Examples would include lawyers drawing up legal documents such as wills on the basis of clients' non-legal input or civil servants drafting new legislation from the directions of elected parliamentarians. An examination of such 'layman-to-expert' INTRA will have to be left out of the investigation, however, owing to the huge obstacles to be foreseen in obtaining authentic instances.

3.4. *Transliteration*

Transliteration (Gottlieb 2008: 57) is the one category that is not represented in either of the two other typologies referred to above (Gottlieb 2007; Petrilli 2003b). It may be defined as a "one-to-one conversion of the graphemes of one writing system into those of another writing system" (Coulmas 1999: 511), such as the rewriting of Greek words with Roman letters (for instance, a word like *μεταφρασή* transliterated into the Latin characters *metaphrasè*). This simplicity of translational procedure may possibly be considered prejudicial to the translational status of the category, since only changes in lettering occur while wordings are left intact. However, although a difference in wording may be a surface characteristic of much translation, especially *interlingual* translation, it cannot be recognized as a necessary condition of translationhood. As mentioned in Section 2, Korning Zethsen and Hill-Madsen (2016) broaden the criterion into any kind of semiotic difference, which would logically include differences between systems of lettering. Hence, transliteration must be recognized as a member of the translation concept.

3.5. *Diamesic INTRA*

Diamesic INTRA (Gottlieb 2008: 56) refers to a change in channel, that is between speech and writing, and may be in either 'direction.' In the same way as the *dialectal* category was seen to constitute a borderline case between inter- and intralingual

translation as such, *diamesic* INTRA may be seen as a borderline case between intralingual and intersemiotic translation, or even, as is Chuang's (2006) view, as truly belonging in the intersemiotic category. Gottlieb (2008: 56), however, cogently refutes this approach, pointing out that diamesic INTRA is language-internal, in other words an *intrasemiotic* phenomenon, because "what is verbal in the source text remains verbal."

The switch from the oral to the graphic channel is exemplified in intralingual subtitles for hearing-impaired TV-viewers (Gottlieb 2008: 57; see also de Linde and Kay 1999: 8-18; Nagel, Hinderer, *et al.* 2009: 45-46), of which a special instance is so-called *subtitle re-speaking*, which consists of the live production of subtitles during TV broadcasts (Lambourne 2006; see also Jekat 2014). As for the opposite diamesic 'direction,' that is writing to speech, an example is audiobooks (Gottlieb 2008: 57). Like intralingual transliteration, the translational status of diamesic INTRA may appear questionable, since the translational procedure 'merely' consists of replacing phonemes with graphemes (or vice-versa). Nevertheless, considering that the function of diamesic transformation is to provide a certain group of recipients with access to semiotic content from which they would otherwise be barred, and since a semiotic barrier (between phonemes and graphemes) is crossed in the process, the view taken here is that diamesic transformation must also be recognized as a type of translation.

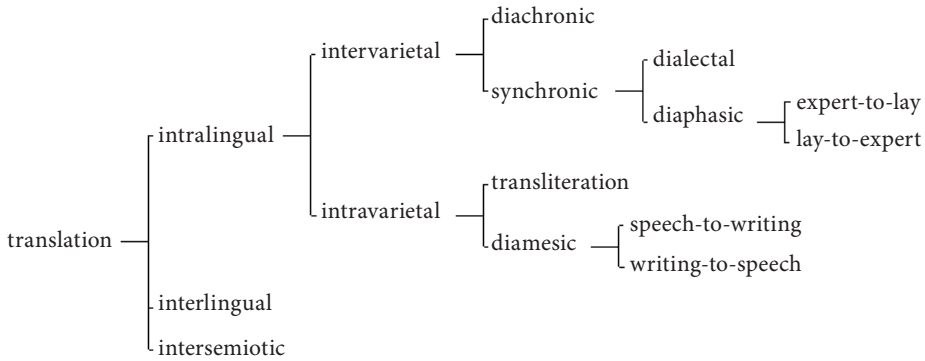

3.6. A summary of revisions proposed

In conclusion to the above review, the modifications proposed ought to be highlighted, along with others that have yet to be brought to the fore. The modifications all consist of the addition of further taxonomic levels to Gottlieb's typology. Firstly, the five species can actually be seen to fall into two distinct categories: Nos. 1-3 (*dialectal*, *diachronic*, and *diaphasic*) and 4-5 (*transliteration* and *diamesic*). The reason is that the first three species are all *intervarietal*, being all concerned with translation between different language varieties: geographical (the *dialectal* species), temporal (the *diachronic* category), and functional (*diaphasic*) (for the equation of registers with 'functional varieties' or 'varieties according to use,' see Halliday 1978: 31-32). As opposed to the first three categories, *transliteration* and *diamesic* INTRA are both *intravarietal*, since the particular language variety of the ST remains unaffected by the rewriting in these two cases. Secondly, a further taxonomic level can be identified in the *intervarietal* category, with the three species subdividing into two superordinate categories, *diachronic* (No. 1) and *synchronic* (Nos. 2 and 3, *dialectal* and *diaphasic* INTRA). Finally, an extension of the *diaphasic* category into two subtypes has already been proposed, that is to say an *expert-to-lay* vs. a *lay-to-expert* subspecies.

A full graphic representation of the revised typology, with modifications and extensions included, is as follows:

FIGURE 2

A fully developed graph of the revised Gottlieb (2008) INTRA typology

4. Empirical section: Case studies of diachronic, dialectal and diaphasic INTRA

The following section will be concerned with case studies⁶ of three out of the five INTRA categories identified in Section 3: 1) a case of dialectal INTRA between the British and the American dialects of English, represented by the American versioning of the first *Harry Potter* novel (Section 4.1); 2) a case of diaphasic INTRA, where a specialized pharmaceutical text is rewritten into an information leaflet aimed at lay readers (Section 4.2); and 3) a case of diachronic INTRA, for which the modernization of an extract from Shakespeare's *Hamlet* has been selected (Section 4.3). Transliteration and diamesic INTRA will be left out of the investigation, partly owing to spatial constraints, but also because both species must be taken to consist, at their core, of completely predictable translation strategies.

As briefly mentioned in the introductory section, *translation strategies* will be conceived of as *shifts* (see van Leuven-Zwart 1989, 1990; Bakker, Koster, *et al.* 2009), that is as changes in lexis and grammar. The analyses will primarily be based on Chesterman's (1997) taxonomy of shift types, but in some cases Chesterman's framework will be supplemented with categories from Newmark (1988), Vinay and Darbelnet (1958/1995), and Vermeer (2008) among others. Since, as the following analyses will show, only a comparatively few shift types altogether are pertinent for present purposes, only relevant categories will be defined, and not until they are needed in the analyses. It should be noted that, also for reasons of space, a few peripheral types of shifts have had to be ignored in the case studies. These primarily pertain to shifts in morphology in the diachronic case.

4.1. Dialectal INTRA: *Harry Potter and the Sorcerer's Stone*

Outside subtitling, the versioning of J. K. Rowling's *Harry Potter* novels for the American readership is probably the most prominent example of dialectal INTRA. The US versions contain a number of intralingual changes which were explicitly motivated – and defended against criticisms – by the American editor, Arthur Levine,

as a deliberate measure to remove potential comprehension obstacles in the original British version for the young American readership (Nel 2002: 274). Here, the nature and extent of these intralingual changes will be investigated in the first novel in the series, published originally in the UK as *Harry Potter and the Philosopher's Stone* (Rowling 1997⁷), and in the US the following year under the title *Harry Potter and the Sorcerer's Stone* (Rowling 1998⁸).

When the two versions are compared, it is immediately apparent – and fully to be expected – that the *degree of transfer* and the *degree of derivation* (defined in the introductory section) are both 100%, as evidenced in the following short extract:

- 1) If the motorbike was huge, it was nothing to the man sitting astride it. He was almost twice as tall as a normal man and at least five times as wide. He looked simply too big to be allowed, and so wild – long tangles of bushy black hair and beard hid most of his face, he had hands the size of dustbin lids, and his feet in their leather boots were like baby dolphins.

(Rowling 1997: 16; British ST)

- a) If the motorcycle was huge, it was nothing to the man sitting astride it. He was almost twice as tall as a normal man and at least five times as wide. He looked simply too big to be allowed, and so wild – long tangles of bushy black hair and beard hid most of his face, he had hands the size of trash can lids, and his feet in their leather boots were like baby dolphins.

(Rowling 1998: 14; American TT)

As Example (1) illustrates, most of the American TT consists of reduplication of ST wordings, making the *degree of translation* very low, with only a very small number of changes between ST and TT being in evidence. Like the ones underlined in Example (1), most are lexical shifts, of which the following is a complete list of those found in the novel as a whole:⁹

TABLE 1

Lexical shifts between the British ST and the American TT

ST (Rowling 1997)	TT (Rowling 1998)	ST (Rowling 1997)	TT (Rowling 1998)
sherbet lemon (p. 13)	lemon drop (p. 10)	chips (p. 92)	fries (p. 123)
motorbike (p. 16)	motorcycle (p. 14)	puddings (p. 93)	desserts (p. 125)
dustbin (p. 16)	trash can (p. 14)	jelly (p. 93)	Jell-O (p. 125)
sellotape (p. 20)	Scotch tape (p. 20)	register (p. 101)	roll call (p. 133)
hamburger bars (p. 21)	hamburger restaurants (p. 22)	pitch (p. 122)	field (p. 164)
cinema (p. 21)	the movies (p. 22)	rounders (p. 124)	baseball (p. 167)
video recorder (p. 21)	VCR (p. 22)	Jacket potato (p. 127)	baked potato (p. 172)
jumper (p. 23)	sweater (p. 24)	bogies (p. 130)	boogers (p. 177)
bobbles (p. 23)	puff balls (p. 24)	changing room (p. 136)	locker room (p. 184)
lolly (p. 24)	pop (p. 26)	fortnight (p. 146)	two weeks (p. 198)
post (p. 30)	mail (p. 34)	crumpets (p. 146)	English muffins (p. 199)
holidaying (p. 30)	vacationing (p. 34)	revision timetables (p. 167)	study schedules (p. 228)
multi-storey car park (p. 36)	multilevel parking garage (p. 43)	revising (p. 167)	studying (p. 229)

packet of crisps (p. 37)	bag of chips (p. 44)	mad (p. 167)	crazy (p. 229)
mint (p. 49)	peppermint (p. 62)	matron (p. 218)	nurse (p. 301)
football (p. 61)	soccer (p. 79)	barking (p. 219)	off his rocker (p. 302)
sweets (p. 76)	candy (p. 101)	drawn (p. 221)	tied (p. 306)

In terms of translation strategies, the items on the above list can largely be divided into instances of *adaptation/cultural filtering* on the one hand and *literal translation* on the other, with certain items appearing as borderline cases. *Literal translation* is defined by Newmark (1988: 46) as follows: “The SL grammatical constructions are converted to their nearest TL equivalents but the lexical words are again translated singly, out of context.” Thus *literal translation* applies to those TT items from the above list that must be deemed “the nearest [US English] equivalent” to the corresponding British English ST item. Examples are pairs like dustbins/trash cans, post/mail, holidaying/vacationing, sweets/candy, register/roll call, pitch/field, fortnight/two weeks. The same even applies to a number of the specific food and sports items, which might otherwise be expected to be culture-specific. Pairs like chips/fries, crisps/chips, lolly/pop, jacket potato/baked potato and football/soccer are all cases where the exact *same* cultural phenomenon is simply labelled differently in the two cultures, and where no change of cultural *content* (see further below) can be said to have taken place. It is noteworthy, for example, that reference to a source-culture phenomenon such as football has in fact been retained through replacement by the lexical item soccer, which is the American label for the European sport that plays only a marginal role in the US.

It needs to be considered, however, if the category *synonymy*, defined by Chesterman (1997: 102) as the selection of “not the ‘obvious’ equivalent but a synonym or near-synonym,” better captures the strategy involved in the instances categorized as *literal translation* above. After all, it was argued that the paired items in examples such as post/mail and holidaying/vacationing are completely synonymous. From the perspective of the English language as a whole, these items must indeed be regarded as dialectal synonyms, but from the perspective of the individual dialect the category of *synonymy* is only relevant if both items (ST and TT item) actually exist within the lexicon of that dialect. That, however, is not the case with (British English) items such as the noun post and the verb holiday, which do not exist in these specific senses in US English. In the American dialect, such elements are indeed ‘foreign’ elements, and hence the category *literal translation* is deemed to make the best analytical sense in these cases. A few cases of *synonymy* do occur, however, which are mad/crazy and timetable/schedule (when these two words are considered in isolation from their combination with revision and study, respectively). Mad and crazy both exist in US English in the sense of ‘insane,’ but the latter item has obviously been chosen in the TT in order to avoid confusion with the informal use of the word (‘very angry’). Timetable and schedule exist in the British dialect, but also in the American and are synonyms in both places.

In connection with certain other ST-TT pairs from the above list, the lexical replacement does entail a decided change in semantic content, with culture-specific British items being replaced by TT items that are specific to American culture. In these cases, the relevant translation-strategy would be Vinay and Darbelnet’s (1958/1995: 39) *adaptation*, used to solve the problem that occurs “where the type of

situation being referred to by the SL language is unknown in the TL culture.” The corresponding category in Chesterman (1997: 108) is *cultural filtering*, which “describes the way in which SL items, particularly culture-specific items, are translated as TL cultural or functional equivalents, so that they conform to TL norms.” It might perhaps be expected that the ‘Americanization’ of the British source text would entail frequent instantiation of this strategy, but only relatively few instances can in fact be identified, such as *rounders/baseball* and *crumpets/English muffins*. *Rounders* and *baseball* refer to relatively similar, but nevertheless different types of sport, and *crumpets* and *English muffins* are not completely identical types of cake. *Jelly/Jell-O* and *sellotape/Scotch tape* are dubious cases, in that TT *Jell-O* is a registered American trademark and thus refers to a branded product, while *jelly*, being a common noun, does not. The same difference applies to *sellotape/Scotch tape*, the latter also being a registered trademark. Whether exactly the same cultural phenomenon is being referred to or not in each of these two pairs must be left an undecided question.

Apart from the lexical shifts, the only other changes are orthographic ones which reflect the familiar differences in British and American English spelling conventions, such as the British *-ise* ending converted into *-ize*, like in *realise* (Rowling 1997: 8; Rowling 1998: 2), the British *-our* converted into American *-or*, like in *armour* (Rowling 1997: 96; Rowling 1998: 129), and the British *-mme* in ST *programme* (Rowling 1997: 32) becoming TT *program* (Rowling 1997: 37). Other similar changes in spelling can be found, but will not receive any further attention here, since in terms of translation strategy they must all be assigned to the category of *literal translation*, just like some of the lexical changes analyzed above. This is because the orthographic changes in the TT represent not only the “nearest” but indeed the direct TL (or target *dialect*) equivalents at the level of graphology.

4.2. Diaphasic INTRA: Patient Information Leaflets

The case study selected for the investigation of diaphasic INTRA is the rewriting of specialized pharmaceutical product specifications (so-called *Summary of Product Characteristics*) as STs into information leaflets aimed at the end user of the medicinal product (official English title: *Patient Information Leaflet*) as TTs. The Patient Information Leaflets, which accompany the packaging of the product, set out the pharmaceutical details that are relevant to the patient: information concerning the ingredients of the drug, the type of medical condition for which the drug is used as a treatment, the proper way to administer it, cases where its use is not recommended, possible side effects, and storage instructions.

All the pharmaceutical information contained in the TTs originates in the specialized STs.¹⁰ However, the information is rewritten in a (mostly) non-expert register, which reflects a legal requirement. According to official guidelines, “the package leaflet should be written in a language understandable by the patient and should reflect the terminology the patient is likely to be familiar with” (EMA 2016: 25). For the case study below, the Summary of Product Characteristics and the Patient Information Leaflet for the product *Cholib* (EMA 2019¹¹), available on the website of the European Medicines Agency, have been chosen.

4.2.1. Degree of transfer, derivation and translation

Of the three INTRA categories investigated in this article, the diaphasic type turns out to be the one that exhibits the lowest degree of both derivation and transfer, as the following example bears out:

- 2) Some evidence suggests that statins as a class raise blood glucose and in some patients, at high risk of future diabetes, may produce a level of hyperglycaemia where formal diabetes care is appropriate. This risk, however, is outweighed by the reduction in vascular risk with statins and therefore should not be a reason for stopping statin treatment. Patients at risk (fasting glucose 5.6 to 6.9 mmol/L, BMI>30 kg/m², raised triglycerides, hypertension) should be monitored both clinically and biochemically according to national guidelines.

(EMA 2019: 6)

- a) While you are on this medicine your doctor will monitor you closely if you have diabetes or are at risk of developing diabetes.

(EMA 2019: 55)

As Example (2) shows, only a few elements from the ST section, for instance in some patients, at high risk of future diabetes and should be monitored, have found their way into the TT as *(your doctor) will monitor you* and *(you) are at risk of developing diabetes*, respectively. Characteristically, the more technical elements from the ST, such as may produce a level of hyperglycaemia, the reduction in vascular risk with statins, and fasting glucose 5.6 to 6.9 mmol/L, BMI>30 kg/m², raised triglycerides, hypertension have been omitted in the TT.

When it comes to the *degree of derivation* represented by the TT as a whole, a rough estimate is that only about half the text originates in the ST. Non-derivation, or *addition* (Chesterman 1997: 109), or the presence of TT elements with no ST origin, occurs, for example in repeated admonitions to consult a medical professional in cases of side effects, doubts about dosage and the like.

With regard to *degree of translation*, the TT also represents far from 100%, in that a certain proportion of the TT elements that do originate in the ST represent pure reduplication. This, too, is in evidence in Example (2) above, where the ST lexical items monitor, risk, and diabetes have all been preserved in the TT.

4.2.2. Translation strategies: Grammatical shifts

Four types of grammatical shifts have been identified, of which two must be assigned to Chesterman's (1997: 96-97) umbrella category *clause structure change*. These are shifts in voice from passive to active and shifts in mood from the declarative to the imperative. The shift in voice was in fact present in Example (2), where the ST wording patients at risk... should be monitored... is rewritten as *your doctor will monitor you*. Since passive constructions tend to be associated with formal, 'bureaucratic' discourse (Charrow 1988), there is good reason to assume that shifts from the passive into the active are motivated by a wish to achieve a less formal register in the TT.

The shift in mood is exemplified in the following pair:

- 3) The tablets should not be crushed or chewed.

(EMA 2019: 2)

- a) Do not crush or chew the tablet.

(EMA 2019: 56)

The ST clause is a declarative which has been turned into an imperative (*Do not crush...*) in the TT. A possible explanation for this shift is that the imperative is the most straightforward way to express a command or an instruction (Matthiessen 1995: 438-39), which is the pragmatic function of the TT segment. It may be noted that the shift in Example (3) combines with a change in voice from passive to active, and it may also be noted that these two grammatical changes are the only two shifts that affect the segment. Both *not* and the three lexical items *crush*, *chew*, and *tablet* are all reduplications of ST items.

The third type of grammatical shift identified is one for which there is no obvious category in Chesterman (1997), Newmark (1988) or Vinay or Darbelnet (1958/1995). It consists of a shift within the person system and has in fact already been illustrated in Example (2), where ST *patients* became TT *you*, that is a third to second person shift based on the replacement of a lexical item (*patient*) with a grammatical one (the pronoun *you*).

A fourth grammatical shift type in the text pair consists of the transformation of noun phrases into clausal structures, called *unit shift* by Catford (1965: 79) and Chesterman (1997: 95):

- 4) Fenofibrate has no or negligible influence on the ability to drive and use machines. (EMA 2019:10)
 - a) Cholib is not expected to affect you being able to drive or use tools or machines. (EMA 2019: 56)

The TT clausal structure *you being able to* is derived from the ST noun phrase the ability to drive, which also involves what Vinay and Darbelnet (1958/1995: 36) term *transposition*, or a change of word class, from noun (*ability*) to adjective (*able*). In the specific cases as in the present where the TT structure is derived from a ST nominalization (*ability*), I suggest the term *de-nominalization*. Since, according to Halliday (1989), nominalized constructions are a key feature of written language, de-nominalization may be interpreted as a means of achieving a more 'spoken' register in the TT (for an extensive analysis of this specific shift type in Hallidayan terms, see Hill-Madsen 2015b).

4.2.3. Lexical shifts

The type of lexical shift which must be deemed central for the purpose of registerial simplification is what is best captured by Piorno's (2012: 181) term *determinologization*, which refers to the replacement of specialized medical and pharmaceutical terms with popular ones. An example is:

- 5) Chronic or acute pancreatitis with the exception of acute pancreatitis due to severe hypertriglyceridaemia. (EMA 2019: 3)
 - a) If you have pancreatitis (inflamed pancreas which causes abdominal pain), which is not caused by high levels of fats in the blood. (EMA 2019: 54)

The TT item *high levels of fats in the blood* is a manifestation of, or is at least very close to, what Vermeer (2008: 7) terms *morphematic translation*, in that the original Greek morphemes of the medical term are recognizable in specific elements of the

TT item: ST hyper- has become TT *high levels of*, triglycerid- has become *fats*, and -aem- has become *blood*. It should be noted that Example (5) also contains another lexical shift type that repeatedly occurs in the text pair, which is synonymy: ST due to has been replaced by *caused by* in the TT. Another example of synonymy was found in Example (4), where ST influence was changed into TT *affect*, with a concomitant change in word class (the ST item is a noun and the TT item a verb).

A shift type that is closely related to, yet slightly different from *determinologization*, is represented by cases where the ST origin is not a decidedly specialized term, but nevertheless a relatively formal/academic one that is replaced by a more colloquial item in the TT. This is seen in Example (6) below, where ST report can hardly be categorized as a technical term, but is nevertheless more formal than TT *tell*:

- 6) All patients starting therapy [...] should be [...] told to report promptly any unexplained muscle pain, tenderness or weakness.

(EMA 2019: 4)

- a) Also tell your doctor or pharmacist if you have a muscle weakness that is constant.

(EMA 2019: 55)

Finally, the shift type known as *paraphrase* is prevalent in the text pair. Chesterman's definition is the following:

The paraphrase strategy results in a TT version that can be described as loose, free, sometimes even undertranslated. Semantic components at the lexeme level tend to be disregarded, in favour of the pragmatic sense of some higher unit such as a whole clause. (Chesterman 1997: 104)

One example is:

- 7) The recommended dose is one tablet per day.

(EMA 2019: 2)

- a) The usual dose is one tablet per day.

(EMA 2019: 56)

The relation between ST recommended and TT *usual* is not explicable in terms of a semantic relation such as synonymy or hyponymy, and rather must be considered a "loose" or "free" rendition, where only a kind of logical or consequential relation appears to obtain between the two items: The dose of one tablet a day may be said to be *usual* because it is the recommended one.

To sum up the translation strategies in the diaphasic case as a whole, it turns out that the range of strategies is somewhat broader than in the dialectal case, spanning not only four lexical categories¹², three of which differed from the ones identified in the *Harry Potter* case, but also four different grammatical types.

4.3. Diachronic INTRA: The case of Shakespeare's Hamlet

According to Delabastita (2017), modernizations of Shakespeare fall into two distinct categories, with some remaining loyal to the iambic pentameter of the original while others are translated into prose. In this investigation, a prose translation has been selected, since a prose version is more likely to bridge the comprehension gap between Shakespeare's original readership and a one. For the present case study, an extract

from the middle of *Hamlet*¹³ was selected, that is the beginning of Act III, Scene 1 (lines 1-57). The modernized TT is taken from Sparknotes.¹⁴

4.3.1. Degree of transfer, derivation and translation

In respect to *degree of transfer* and *derivation*, it turns out that the diachronic INTRA of *Hamlet* is quite similar to the *Harry Potter* case, in that both *transfer* and *derivation* are close to 100%:

8) ROSENCRANTZ

- 16 Madam, it so fell out, that certain players
 17 We o'erraught on the way. Of these we told him,
 18 And there did seem in him a kind of joy
 19 To hear of it. They are about the court,
 20 And, as I think, they have already order
 21 This night to play before him.

(Shakespeare ~1602/2002: 64)

a) ROSENCRANTZ

Madam, some actors happened to cross our paths on the way here. We told Hamlet about them, and that seemed to do him good.
 They are here at court now, and I believe they've been told to give a performance for him tonight.

(Shakespeare ~1602/2006, in Sparknotes)

Virtually all ST content in Example (8) has been transferred to the TT, with the exception of the ST element To hear of it, for which there appears to be no corresponding TT element. A handful of similar elements in the ST extract as a whole have not been transferred, which means that the *degree of transfer* is actually not a full 100%. In the TT, it is debatable whether all elements can in fact be traced back to corresponding ST elements. With regard to *degree of translation*, the underlined elements in Example (8) are those which represent grammatical and lexical changes, illustrating that a considerable proportion of the TT is constituted by reduplication of ST items. The relatively small size of the sample selected here (namely the first 57 lines of Act III) has in fact made it possible to reach a rather precise calculation of the translation degree. The TT extract numbers 371 words in total (excluding the names indicating who speaks the lines), of which 239 words represent translation and 132 represent mere reduplication of ST words. This makes the *degree of translation* in the sample 64.4%, or about two thirds. What Example (8) also illustrates is the nature of the non-translated elements, which primarily include grammatical items such as pronouns (We, him, They, I), articles (the), conjunctions (and) and prepositions (on), whereas most of the lexical items have been translated. Exceptions are relatively simple lexical items such as way, told, seem, and night.

4.3.2. Translation strategies: Grammatical shifts

Only relatively few instances of grammatical shifts have been uncovered in the sample, with the majority belonging to one single category, which is the one previously termed *de-nominalization*:

9) **POLONIUS**

- 46 [...] (to OPHELIA) Read on this
 47 book
 48 That show of such an exercise may color
 49 Your loneliness.

(Shakespeare ~1602/2002: 65)

a) **POLONIUS**

- [...] (to OPHELIA)–Read from this prayer book, so it looks natural that you're all alone.

(Shakespeare ~1602/2006, in Sparknotes)

The ST nominalization Your loneliness has been converted into the TT clause you're all alone, where the ST possessive pronoun Your now features as the subject pronoun you in the TT and the adjectival root of ST loneliness has become subject complement in the TT.

The only other grammatical strategies that can be identified are two cases that belong in Chesterman's (1997: 96-97) category *clause structure change*. These shifts were both seen in Example (8), where the subordinate clause (that certain...) of ST Madam, it so fell out, that certain players / We o'erraught on the way has been rearranged so that what is the direct object in the ST (certain players) is made to serve as the subject in the corresponding TT clause some actors happened to cross our paths on the way here. In the next sentence in Example (8) (original Shakespeare, line 17), Of these we told him, a change of constituent order has taken place so that the complement that occupies thematic position in the ST (Of these) has been moved to the end position in the TT (We told him about these).

4.3.3. *Translation strategies: Lexical shifts*

Among the lexical shifts, *literal translation* is also represented in the present case study, as in Example (10) below:

10) **GERTRUDE**

- 14 Did you assay him?
 15 To any pastime?

(Shakespeare ~1602/2002: 64)

a) **GERTRUDE**

- Did you try tempting him with some entertainment?

(Shakespeare ~1602/2006, in Sparknotes)

According to the *Oxford English Dictionary*¹⁵, one of the senses of assay is, or rather was, indeed 'tempt.' Since the ST item is now obsolete in English, and since tempt must thus be considered "the nearest TL equivalent" (Newmark 1988: 46, which we quote yet again) the shift is a case of *literal translation* between the two diachronic varieties. Other unequivocal instances are ST hither (line 30) translated into TT here and ST affront into run into in Example (11) below:

11) **CLAUDIUS**

- 29 Sweet Gertrude, leave us too,
 30 For we have closely sent for Hamlet hither,
 31 That he, as 'twere by accident, may here
 32 Affront Ophelia.

(Shakespeare ~1602/2002: 65)

a) **CLAUDIUS**

Dear Gertrude, please give us a moment alone. We've secretly arranged for Hamlet to come here so that he can run into Ophelia.

(Shakespeare ~1602/2006, in Sparknotes)

Hither as well as affront in the specific senses used here are both obsolete and have both been replaced by modern-English equivalents in the TT.

While *literal translation* is a strategy which the present case has in common with the *Harry Potter* case, it is interesting to note that certain lexical strategies found in the diachronic case also overlap with those uncovered in the diaphasic case. Thus, *synonymy* is a frequent strategy:

12) **ROSENCRANTZ**

5 He does confess he feels himself distracted.

6 But from what cause he will by no means speak.

(Shakespeare ~1602/2002: 64)

a) **ROSENCRANTZ**

He admits he feels confused, but refuses to say why.

(Shakespeare ~1602/2006, in Sparknotes)

Both TT admits and say must be regarded as synonyms of ST confess and speak, respectively. Another strategy observable in Example (12) is one which has not been found in either of the two other case studies: *compression*, defined by Chesterman (1997: 104) as “the distribution of the ‘same’ semantic components over [...] fewer items.” In Example (12), this is in evidence in ST will by no means becoming TT refuses and ST from what cause becoming TT why. This is a relatively frequent strategy which explains why the TT segments are often somewhat shorter than the corresponding ST segments.

Two other strategies manifested in the extract are *paraphrase* and *explicitation*, the latter being definable as “the technique of making explicit in the TT information that is implicit in the ST” (Klaudy 2008: 104; for similar definitions, see Chesterman 1997: 108-9 and Vinay and Darbelnet 1958/1995: 342). Both categories occur in Example (13) below:

13) **POLONIUS**

49 [...] We are oft to blame in this,

50 ‘Tis too much proved, that with devotion’s visage

51 And pious action we do sugar o’er

52 The devil himself.

(Shakespeare ~1602/2002: 65)

a) **POLONIUS**

Come to think of it, this happens all the time—people act devoted to God to mask their bad deeds.

(Shakespeare ~1602/2006, in Sparknotes)

TT this happens all the time is a paraphrase, a free rendering, of the ST unit ‘Tis too much proved, in that there is no synonymy between individual lexical items. The instance of *explicitation* occurs in the TT unit to God, which must be considered implicit in ST devotion, possibly together with pious action. What Example (13) also instances is a strategy that falls under Chesterman’s (1997: 105-6) category *trope change*, which is an umbrella term for a number of more specific ways of translating

metaphors. Here the term *de-metaphorization* is preferred as a reference to the particular strategy in evidence in Example (13), where the metaphorical ST expression The devil himself is rendered non-metaphorically as TT *bad deeds*. To the extent that TT *mask* may be said to have lost its metaphoricity, the item similarly represents demetaphorization, namely of ST sugar o'er.

5. Conclusion

This article has aimed to contribute to the description of intralingual translation, partly through typologization of the phenomenon and partly through a comparative investigation of three subtypes. In the theoretical discussion, Gottlieb's (2008) taxonomy was reviewed and modified through the addition of further taxonomic levels. Empirically, the article has charted the heterogeneity in the transformation of STs into intralingual TTs along four parameters, and while considerable diversity was indeed found in all four aspects, certain points of similarity were also identified. Thus, in respect of *degree of translation*, what emerges as a central characteristic of all three types of INTRA investigated is the fact that they are *partial* translations only, in that the derivation of TT content from ST content was found to be only partially a result of *changes* across the ST-TT divide. As a logical result, reduplication of ST items in the TT was seen to be a prominent feature of all three species, though to markedly different extent. In two other respects, namely *degree of transfer* and *degree of derivation*, the diaphasic case was seen to differ from both the dialectal and the diachronic case because only a minor part of the ST content was found to be represented in the TT and because certain TT content was seen to be without origin in the ST. With regard to translation strategies, the investigation also uncovered considerable diversity, since in each case study one or several lexical shift types were identified that proved unique to that particular case: *cultural filtering/adaptation* in the dialectal case, *de-terminologization* in the diaphasic case, and *de-metaphorization*, *compression*, and *explicitation* in the diachronic case. Moreover, the three cases differed significantly when it came to grammatical strategies, with the *diaphasic* case being the only one where grammatical shifts were prominent, whereas the shifts identified in the two other cases were either predominantly or even exclusively lexical. On the other hand, some overlap in translation strategies was also registered. *Synonymy* was observed in all three cases studies, and *literal translation* was seen to apply to two (*dialectal* and *diachronic*), as did *paraphrase* (*diaphasic* and *diachronic*).

Despite these overlaps, the final conclusion is that when the three cases are compared from an overall perspective, it turns out that the diachronic and the diaphasic cases have more in common with each other than with the dialectal case, and that the *Harry Potter* case is 'the odd man out' in the comparison. The *Shakespeare* case and the diaphasic case both exhibited a relatively large variety of translation strategies, which the *Harry Potter* case did not. Similarly, the two cases (*diachronic* and *diaphasic*) both exhibited a relatively high *degree of translation*, unlike the *Harry Potter* case where the translation degree proved extremely low – so low, in fact, that the American version as a whole barely qualifies as a case of *translation*. Presumably, the explanation for these differences is to be found in the proximity/distance between the intralingual varieties involved in each case. There is a marked distance between Shakespearean and modern English (the *diachronic* case) and possibly an even greater distance

between the specialized register of the pharmaceutical texts and the general-language register of the Patient Information Leaflets (the *diaphasic* case). The differences between the two English dialects investigated in the *Harry Potter* case, on the other hand, are in fact very few. This appears to explain the high degree of mere reduplication from ST to TT and the very limited range of translation strategies in the *dialectal* case. A more elaborate attempt to explain the differences observable between the individual types of INTRA, however, must remain the subject of a future study.

Coda

During the review process of this article, a number of interesting theoretical points were debated that are highly pertinent to the ongoing debate within TS about the very definition of the translation concept and about the status of INTRA within TS. As a coda to the article, the four most salient points in the debate, along with the clarifications that the debate gave rise to, are reproduced here.

A first point concerned the article's dismissal (in Section 2) of 'folk' conceptualizations of translation. A clarification of the article's standpoint is that 'folk' notions regarding translation, while far from meaningless and to be simply ignored, may be unacceptably narrow by disregarding translational phenomena that should be theoretically recognized as such (for instance INTRA). Thus, a scholarly conceptualization may well be able to adopt certain elements of a lay perspective that are found to be theoretically valid, whereas the reverse is much less likely to be the case.

A second point of contention sprang from the fact that, in the article's discussion of Gottlieb's (2008) INTRA typology, all subcategories are accorded equal and full membership in the superordinate translation concept, rather than gradient membership, which would have been the consequence if a prototype/family-resemblances approach had been adopted. The reason why a prototype/gradient/scalar concept (in the case of INTRA) was not taken into consideration is that such a concept is an unclear one with an underspecified content. If gradient membership was assigned to the members of the INTRA category, then what exactly, it must be asked, are the characteristics that the five subcategories purportedly exhibit to such varying degrees? If, for example, the switch between two divergent lexico-grammatical systems is to be seen as one such key characteristic, then it must be asked why such a characteristic should be ascribed centrality. A conceivable answer is that it is a feature which unites virtually all interlingual translation, and that interlingual translation represents the prototypical case of translation, but this only begs the question why interlingual translation is the prototypical case. If the answer is that interlingual translation involves a switch between two different lexicogrammatical systems (for example, the grammar-lexis of English vs. that of French), then the argument is circular. And if the answer is that interlingual translation is what is prototypically meant by the word 'translation' in ordinary parlance, it is a definition which has brought us back to the lay notions on which that no scientific discipline can and should be based. What the above deliberations show is that unequivocal, scholarly argued definitions are unavoidable in any scientific pursuit (see also Robinson 2011: 69-70), which is exactly why in Korning Zethsen and Hill-Madsen (2016: 704-5) we concluded by formulating a criterial definition of the translation concept which specified clear criteria for membership, and on which a scientific taxonomy of trans-

lation could be built. Membership under such terms is absolute and not gradable, which, however, does not mean that membership is equally *obvious* in all cases. Nevertheless, the point is that in each case the question can be settled with reference to the specified criteria for membership. In the present article, such consideration of membership is undertaken with both the diamesic category and with transliteration (Sections 3.4 and 3.5), since both categories admittedly represent some of the less obvious types of translation in the INTRA typology.

A third point of debate was whether, by extending the translation concept to INTRA, the article risks ‘diluting’ the concept to such a degree that any kind of rewriting or metatextuality must be recognized as translation. This danger, however, is precluded by the very fact that the article’s definition of the translation concept is a criterial one. The two criteria are: the neutralization of a comprehension obstacle and the presence of a semiotic border between ST and TT, or a border between two different meaning-making systems. This means that intralingual rewriting as such, for instance a summary of a longer text in the same language, would not in itself qualify as translation, whereas the presence of a semiotic border such as that between two different registers would. Thus, summaries of specialized texts for lay readers may be regarded as intralingual translations. Obviously, in the same way as the semiotic-border criterion was applied to certain INTRA species (transliteration and diamesic INTRA), the criterion must be rigorously applied to borderline cases *within* the individual subcategories. As a case in point where the ST-TT difference appears to be so negligible as to render the INTRA concept absurd is the borderline example of transliteration where a typeface is simply enlarged to facilitate reading and comprehension for elderly people. Measured against the two criteria, however, this example would not qualify as INTRA. Though such a transformation may indeed facilitate comprehension, no semiotic border is crossed between ST and TT in this case, since enlarging a typeface is simply a matter of ‘turning up the volume’ of the channel and corresponds to raising one’s voice in spoken interaction. Another borderline case of transliteration that must be discounted is the conversion of the Gothic script into ‘ordinary’ Latin characters (or vice-versa): Since the Gothic script does not in effect constitute an independent alphabet, but simply a different font and thus not a different meaning-making system, the example must be excluded from the translation category. The difference, for example, between the Greek and the Roman alphabets, on the other hand, *is* one between two different meaning-making systems (α , β , γ , δ , etc. vs. *a*, *b*, *c*, *d*, etc.) and so is the diamesic difference between a phonemic system (*/ɔ/*, */ʌ/*, */ə/*, */ŋ/*, etc.) and a system of graphemes (*o*, *u*, *e*, *-ng-*, etc.).

A final point worth clarifying pertains to the status of shifts in translation. It is important to emphasize that the presence of shifts in the three case studies is in no way to be read as ‘proof’ of translationhood. The article in no way aims to deduce translationhood from the occurrence of (certain) shifts and the empirical analyses thus do not serve as the ‘building blocks’ of any larger theoretical argument. The reverse, rather, is the case. Since the three empirical cases can *theoretically* be argued to be instances of translation, the implicit assumption is that the analytical tools of translation studies (in this case shift analysis) can be fruitfully applied in the empirical investigation of them. The analyses of shifts in the three case studies are thus to be seen as empirical research in their own right, aimed at uncovering (part of) the nature of the three INTRA subtypes in question.

NOTES

1. PLAIN LANGUAGE ACTION AND INFORMATION NETWORK (Last update: 30 March 2019): Why use plain language? *plainlanguage.gov*. Consulted on 19 May 2019, <<https://www.plainlanguage.gov/about/benefits/>>.
2. COURT OF JUSTICE OF THE EUROPEAN UNION (1996-): Press releases. *CURIA*. Consulted on 19 September 2018, <https://curia.europa.eu/jcms/jcms/Jo2_7052/en/>.
3. EUROPEAN MEDICINES AGENCY (Last update: 30 July 2019): European public assessment reports: background and context. *European Union*. Consulted on 1 May 2019, <<https://www.ema.europa.eu/en/medicines/what-we-publish-when/european-public-assessment-reports-background-context>>.
4. LIBAK, Anna (11 January 2013): Forstyr Gravfreden! [Desecrate the graves!]. *Weekendavisen*. 4.
5. See also Gottlieb (2018) for a very recent version of the typology. For a non-typological description of INTRA, see Zethsen (2009).
6. We have so far been using italics to highlight terms and concepts. To better distinguish the ST and TT, we will be using the following typography: *ST examples* and *TT examples*.
7. ROWLING, Joanne K. (1997): *Harry Potter and the Philosopher's Stone*. London: Bloomsbury.
8. ROWLING, Joanne K. (1998): *Harry Potter and the Sorcerer's Stone*. New York: Scholastic Inc.
9. The list is a result of a careful scrutiny of both versions in their entirety
10. For a charting of the derivation of TT sections from corresponding ST sections, see van Vaerenbergh (2007: 172) and EUROPEAN MEDICINES AGENCY (Last update: 28 July 2019): QRD product-information annotated template (English). Version 10.1. *European Union*. 25-39. Consulted 10 August 2019, <https://www.ema.europa.eu/en/documents/template-form/qrd-product-information-annotated-template-english-version-101_en.pdf>.
11. Both ST and TT are contained in the document. EUROPEAN MEDICINES AGENCY (Last update: 12 March 2019): Cholib: EPAR - Product Information. *European Union*. Consulted on 11 April 2019, <https://www.ema.europa.eu/en/documents/product-information/cholib-epar-product-information_en.pdf>.
12. For a lexical analysis of diaphasic INTRA by means of concepts from Systemic-Functional Linguistics not covered in the present article, see Hill-Madsen (2015a).
13. SHAKESPEARE, William (~1602/2002): *Hamlet*. (Edited by Roma GILL) Oxford: Oxford University Press.
14. SHAKESPEARE, William (~1602/2006): Act III, Scene 1. In: William SHAKESPEARE. *Hamlet*. Sparknotes. Consulted on 29 October 2017, <http://nfs.sparknotes.com/hamlet/page_134.html>.
15. *Oxford English Dictionary Online* (2019): Assay, v. Oxford: Oxford University Press. Consulted on 19 November 2018, <<https://www.oed.com/view/Entry/11757?rskey=3mqqwf&result=2&isAdvanced=false>>.
